Code Horizons

October 2, 2024

Making it easier to be tidy

Load the packages, as always

```
library(here)      # manage file paths
library(socviz)    # data and some useful functions
library(tidyverse) # your friend and mine
library(haven)     # for Stata, SAS, and SPSS files

library(broom)     # tidy model summaries
```

Moving ahead

Some helpful things

The **reprex** package

reprex

part of the tidyverse

2.0.0.9000

Reference

Articles ▾

News ▾

Overview

Prepare reprexes for posting to [GitHub issues](#), [StackOverflow](#), in Slack [messages](#) or [snippets](#), or even to paste into PowerPoint or Keynote slides. What is a `reprex`? It's a **re**producible **ex**ample, as coined by [Romain Francois](#).

Given R code on the clipboard, selected in RStudio, as an expression (quoted or not), or in a file ...

- run it via `rmarkdown::render()`,
- with deliberate choices re: `render()` arguments, knitr options, and Pandoc options.

Get resulting runnable code + output as

- Markdown, suitable for GitHub or Stack Overflow or Slack, or as
- R code, augmented with commented output, or as
- Plain HTML or (experimental) Rich Text

The result is returned invisibly, written to a file and, if possible, placed on the clipboard. Preview an HTML version in RStudio viewer or default browser.

Installation

Best demonstrated live

When asking for help, make a **reproducible example**

```
library(reprex)
```

```
library(tidyverse)
```

```
starwars >
  count(homeworld, species) >
  mutate(pct = n / sum(n) * 100) >
  arrange(desc(pct))
```

```
# A tibble: 57 × 4
  homeworld species      n  pct
  <chr>      <chr>   <int> <dbl>
1 Tatooine   Human         8  9.20
2 <NA>       Human         6  6.90
3 Naboo      Human         5  5.75
4 Alderaan   Human         3  3.45
5 Naboo      Gungan         3  3.45
6 <NA>       Droid          3  3.45
7 Corellia   Human          2  2.30
8 Coruscant  Human          2  2.30
9 Kamino     Kaminoan        2  2.30
10 Kashyyyk  Wookiee         2  2.30

Search...

usethis

usethis is a workflow package: it automates repetitive tasks that arise during project setup and development, both for R packages and non-package projects.

Installation

Install the released version of usethis from CRAN:

```
install.packages("usethis")
```

Or install the development version from GitHub with:

```
# install.packages("devtools")
devtools::install_github("r-lib/usethis")
```

Usage

Most `use_*`() functions operate on the *active project*: literally, a directory on your computer. If you've just used usethis to create a new package or project, that will be the active project. Otherwise, usethis verifies that current working directory is or is below a valid project directory and that becomes the active project. Use `proj_get()` or `proj_sitrep()` to manually query the project and [read more in the docs](#).

A few usethis functions have no strong connections to projects and will expect you to provide a path.

Tables, tables, tables

The `gtsummary` package is very powerful. There are a number of other very good tidy table-making options too.

```
library(gtsummary)
```

```
trial
```

```
# A tibble: 200 × 8
```

	trt	age	marker	stage	grade	response	death	ttdeath
	<chr>	<dbl>	<dbl>	<fct>	<fct>	<int>	<int>	<dbl>
1	Drug A	23	0.16	T1	II	0	0	24
2	Drug B	9	1.11	T2	I	1	0	24
3	Drug A	31	0.277	T1	II	0	0	24
4	Drug A	NA	2.07	T3	III	1	1	17.6
5	Drug A	51	2.77	T4	III	1	1	16.4
6	Drug B	39	0.613	T4	I	0	1	15.6
7	Drug A	37	0.354	T1	II	0	0	24
8	Drug A	32	1.74	T1	I	0	1	18.4
9	Drug A	31	0.144	T1	II	0	0	24
10	Drug B	34	0.205	T3	I	0	1	10.5

```
# i 190 more rows
```

Tables, tables, tables

The **gtsummary** package is very powerful. There are a number of other very good tidy table-making options too.

```
trial >
tbl_summary(
  include = c(age, grade, response),
  by = trt, # split table by group
  missing = "no" # don't list missing data separately
) >
add_n() > # add column with total number of non-missing observations
add_p()
```

Tables, tables, tables

Characteristic	N	Drug A N = 98 ¹	Drug B N = 102 ¹	p-value
Age	189	46 (37, 60)	48 (39, 56)	
Grade	200			
I		35 (36%)	33 (32%)	
II		32 (33%)	36 (35%)	
III		31 (32%)	33 (32%)	
Tumor Response	193	28 (29%)	33 (34%)	
¹ Median (Q1, Q3); n (%)				

Tables, tables, tables

`gtsummary()` straight out of the box:

```
gss_sm >
  select(race, degree, marital) >
  drop_na() >
  tbl_summary(
    by = race, # split table by group
    missing = "no" # don't list missing data separately
  ) >
  bold_labels()
```

Tables, tables, tables

Characteristic	White N = 2,096 ¹	Black N = 487 ¹	Other N = 276 ¹
degree			
Lt High School	197 (9.4%)	60 (12%)	71 (26%)
High School	1,057 (50%)	292 (60%)	112 (41%)
Junior College	166 (7.9%)	33 (6.8%)	17 (6.2%)
Bachelor	426 (20%)	71 (15%)	39 (14%)
Graduate	250 (12%)	31 (6.4%)	37 (13%)
marital			
Married	979 (47%)	121 (25%)	110 (40%)
Widowed	196 (9.4%)	35 (7.2%)	18 (6.5%)
Divorced	363 (17%)	93 (19%)	39 (14%)
Separated	55 (2.6%)	27 (5.5%)	20 (7.2%)
Never Married	503 (24%)	211 (43%)	89 (32%)
¹ n (%)			

Tables, tables, tables

With a bit more work ...

```
trial ▷  
  select(trt, age, marker) ▷  
  tbl_summary(  
    by = trt,  
    type = all_continuous() ~ "continuous2",  
    statistic = all_continuous() ~ c("{N_nonmiss}",  
                                     "{mean} ({sd})",  
                                     "{median} ({p25}, {p75})",  
                                     "{min}, {max}"),  
    missing = "no") ▷  
  italicize_levels()
```

Tables, tables, tables

Characteristic	Drug A N = 98	Drug B N = 102
Age		
<i>N Non-missing</i>	91	98
<i>Mean (SD)</i>	47 (15)	47 (14)
<i>Median (Q1, Q3)</i>	46 (37, 60)	48 (39, 56)
<i>Min, Max</i>	6, 78	9, 83
Marker Level (ng/mL)		
<i>N Non-missing</i>	92	98
<i>Mean (SD)</i>	1.02 (0.89)	0.82 (0.83)
<i>Median (Q1, Q3)</i>	0.84 (0.23, 1.60)	0.52 (0.18, 1.21)
<i>Min, Max</i>	0.00, 3.87	0.01, 3.64

The power of lists

Similar to earlier, but simpler:

```
library(gapminder)

## Fit as a function, for clarity
fit_ols <- function(df) {
  lm(lifeExp ~ log(gdpPercap), data = df)
}

out_le <- gapminder >
  filter(continent %in% "Oceania") >
  group_by(continent) >
  nest() >
  mutate(model = map(data, fit_ols),
         mod_sum = map(model, glance),
         mod_terms = map(model, tidy, conf.int = TRUE),
         ) >
  unnest(cols = c(mod_terms))
```

The power of lists

```
out_le
```

```
# A tibble: 8 × 11
# Groups:   continent [4]
  continent data      model mod_sum term estimate std.error statistic p.value
  <fct>      <list>   <lis> <list> <chr>    <dbl>    <dbl>    <dbl>    <dbl>
1 Asia      <tibble> <lm>  <tibble> (Int...  9.58     2.71      3.54 4.46e- 4
2 Asia      <tibble> <lm>  <tibble> log(...  6.25     0.331    18.9 3.73e- 57
3 Europe    <tibble> <lm>  <tibble> (Int... 13.0     1.92      6.76 5.52e- 11
4 Europe    <tibble> <lm>  <tibble> log(...  6.31     0.205    30.8 8.06e-103
5 Africa    <tibble> <lm>  <tibble> (Int...  7.60     2.63      2.89 4.03e- 3
6 Africa    <tibble> <lm>  <tibble> log(...  5.69     0.361    15.8 1.86e- 47
7 Americas  <tibble> <lm>  <tibble> (Int... -19.1     4.82     -3.95 9.65e- 5
8 Americas  <tibble> <lm>  <tibble> log(...  9.72     0.558    17.4 2.51e- 47
# i 2 more variables: conf.low <dbl>, conf.high <dbl>
```

The power of lists

```
## Nice formatting of the numbers
## There are many convenience packages
## like this; it's not too hard to write your own, either
# remotes::install_github("tjmahr/printy")

text_ready ← out_le ▷
  mutate(
    across(c(estimate, conf.low, conf.high),
      printy::fmt_fix_digits, 2),
    se = printy::fmt_fix_digits(std.error, 3),
    ci = glue::glue("[{conf.low}, {conf.high}]")
  ) ▷
  select(continent, term, estimate, se, ci)
```

The `printy` package is by [T.J. Mahr](#)

The power of lists

```
text_ready
```

```
# A tibble: 8 × 5
# Groups:   continent [4]
  continent term      estimate se      ci
  <fct>      <chr>      <chr>   <chr> <glue>
1 Asia      (Intercept)    9.58    2.706 [4.26, 14.90]
2 Asia      log(gdpPercap) 6.25    0.331 [5.60, 6.90]
3 Europe    (Intercept)   12.97    1.917 [9.19, 16.74]
4 Europe    log(gdpPercap) 6.31    0.205 [5.91, 6.71]
5 Africa    (Intercept)    7.60    2.632 [2.43, 12.77]
6 Africa    log(gdpPercap) 5.69    0.361 [4.98, 6.40]
7 Americas  (Intercept)   -19.07    4.824 [-28.56, -9.58]
8 Americas  log(gdpPercap) 9.72    0.558 [8.62, 10.82]
```

The power of **lists**

Now ...

```
stats ← text_ready ▷  
  mutate(term = janitor::make_clean_names(term)) ▷  
  printy::super_split(continent, term) # Thanks again, TJ Mahr
```

The power of lists

Why are we doing this?

```
stats
```

```
$Africa
$Africa$intercept
# A tibble: 1 × 5
# Groups:   continent [1]
  continent term      estimate se      ci
  <fct>     <chr>      <chr>   <chr> <chr>
1 Africa intercept 7.60     2.632 [2.43, 12.77]

$Africa$log_gdp_percap
# A tibble: 1 × 5
# Groups:   continent [1]
  continent term      estimate se      ci
  <fct>     <chr>      <chr>   <chr> <chr>
1 Africa log_gdp_percap 5.69     0.361 [4.98, 6.40]

$Americas
$Americas$intercept
# A tibble: 1 × 5
```

The power of lists

The Intercept term for Africa was 'r stats\$Africa\$intercept\$estimate' 'r stats\$Africa\$intercept\$ci'.

For Europe it was 'r stats\$Europe\$intercept\$estimate' 'r stats\$Europe\$intercept\$ci'

The Intercept term for Africa was 7.60 [2.43, 12.77].

For Europe it was 12.97 [9.19, 16.74].

10	AUS	Austral...	AU	Oceania	AUS	2015	1	f	1	0

```
# i 576,830 more rows
```

```
# i 7 more variables: forecast <dbl>, approx_date <date>, age_group <chr>,
```

```
# death_count <dbl>, death_rate <dbl>, deaths_total <dbl>, rate_total <dbl>
```

For example, manually

```
## stmf
stmf_colnames ← c("country_code", "cname", "iso2", "continent", "iso3", "year",
                  "week", "sex", "split", "split_sex", "forecast", "approx_date",
                  "age_group", "death_count", "death_rate", "deaths_total", "rate_total")

all.equal(colnames(stmf), stmf_colnames)
```

```
[1] TRUE
```

Imagine how you might build up a set of tests and checks

But you don't have to manage this manually

Use **testthat** to check things

```
## countries
test_that("countries conforms to spec", {
  countries_colnames ← c("cname", "iso3", "iso2", "continent")
  expect_equal(colnames(countries), countries_colnames)
})

## stmf
test_that("stmf conforms to spec", {
  stmf_colnames ← c("country_code", "cname", "iso2", "continent", "iso3", "year",
                    "week", "sex", "split", "split_sex", "forecast", "approx_date",
                    "age_group", "death_count", "death_rate", "deaths_total", "rate_total")
  expect_equal(colnames(stmf), stmf_colnames)
})
```

Use **testthat** to check things

```
testthat::test_dir(here("tests", "testthat"))

## ✓ | OK F W S | Context
##
## - | 0 | stmf
## - | 0 | Validating package data objects
## ✓ | 2 | Validating package data objects
##
## == Results ==
## [ FAIL 0 | WARN 0 | SKIP 0 | PASS 2 ]
```

testthat in practice

Oriented towards package development

Consider packaging your datasets! Benefits to documentation/codebooks etc

One-table example: [uscenpops](#)

More extensive: [covdata](#)

How R packages work: [Wickham & Bryan](#)

Summarizing your wrangling with **skimr**

We might want to make a **codebook** of our data

```
library(skimr)
```

Summarize with **skimr**

We might want to make a **codebook** of our data

```
library(skimr)  
organdata ← read_csv(here("data", "organdonation.csv"))
```

Summarize with **skimr**

```
organdata > skim(where(is.numeric)) > partition()
```

Variable type: numeric
